

Calculation Methodology

ESG_Data_Asset_Package_v1.0 - block ESG-DA-2026-001

Economic metrics are derived from the 10-sector supply and use tables using the Leontief input-output model. Technical coefficients are computed as $A = Z / x$, where Z is the inter-sector flow matrix and x the gross output vector; total requirements follow from $(I - A)^{-1}$.

ESG indicators are reported per sector for FY2025 and mapped to GRI 305-1, GRI 305-2, GRI 401-1, ESRS E1-6, ESRS S1-6 and IFRS S2. Values in the workbooks are computed from 01_Raw_Data; no figure is entered manually.
